**3-Pyridyl xyalkyl Heterocyclic Ether Compounds  
Useful in Controlling Chemical Synaptic Transmission**

Technical Field

5        This invention relates to 3-pyridyloxymethyl heterocyclic ether compounds which control chemical synaptic transmission; to therapeutically-effective pharmaceutical compositions of these compounds; and to the use of said compositions to selectively control synaptic transmission.

10      Background of the Invention

Compounds that selectively control chemical synaptic transmission offer therapeutic utility in treating disorders that are associated with dysfunctions in synaptic transmission. This utility may arise from controlling either pre-synaptic or post-synaptic chemical transmission. The control of synaptic chemical transmission is, in turn, a direct result of a 15 modulation of the excitability of the synaptic membrane. Presynaptic control of membrane excitability results from the direct effect an active compound has upon the organelles and enzymes present in the nerve terminal for synthesizing, storing, and releasing the neurotransmitter, as well as the process for active re-uptake. Postsynaptic control of membrane excitability results from the influence an active compound has upon the 20 cytoplasmic organelles that respond to neurotransmitter action.

An explanation of the processes involved in chemical synaptic transmission will help to illustrate more fully the potential applications of the invention. (For a fuller explanation of chemical synaptic transmission refer to Hoffman *et al.*, "Neurotransmission: The autonomic and somatic motor nervous systems." In: Goodman and Gilman's. The Pharmacological Basis of Therapeutics. 9th ed., J.G. Hardman, L.E. Limbird, P.B. Molinoff, R.W. Ruddon, and A. Goodman Gilman, eds., Pergamon Press, New York, 1996, pp. 105-139).

Typically, chemical synaptic transmission begins with a stimulus that depolarizes the transmembrane potential of the synaptic junction above the threshold that elicits an 30 all-or-none action potential in a nerve axon. The action potential propagates to the nerve terminal where *ion fluxes* activate a mobilization process leading to neurotransmitter secretion and "transmission" to the postsynaptic cell. Those cells which receive communication from the central and peripheral nervous systems in the form of neurotransmitters are referred to as "excitable cells." Excitable cells are cells such as 35 nerves, smooth muscle cells, cardiac cells and glands. The effect of a neurotransmitter upon an excitable cell may be to cause either an excitatory or an inhibitory postsynaptic potential (EPSP or IPSP, respectively) depending upon the nature of the postsynaptic receptor for

the particular neurotransmitter and the extent to which other neurotransmitters are present. Whether a particular neurotransmitter causes excitation or inhibition depends principally on the ionic channels that are opened in the postsynaptic membrane (i.e., in the excitable cell).

EPSPs typically result from a local depolarization of the membrane due to a 5 generalized increased permeability to cations (notably  $\text{Na}^+$  and  $\text{K}^+$ ), whereas IPSPs are the result of stabilization or hyperpolarization of the membrane excitability due to a increase in permeability to primarily smaller ions (including  $\text{K}^+$  and  $\text{Cl}^-$ ). For example, the neurotransmitter acetylcholine excites at skeletal muscle junctions by opening permeability channels for  $\text{Na}^+$  and  $\text{K}^+$ . At other synapses, such as cardiac cells, acetylcholine can be 10 inhibitory, primarily resulting from an increase in  $\text{K}^+$  conductance.

The biological effects of the compounds of the present invention result from 15 modulation of a particular subtype of acetylcholine receptor. It is, therefore, important to understand the differences between two receptor subtypes. The two distinct subfamilies of acetylcholine receptors are defined as nicotinic acetylcholine receptors and muscarinic 20 acetylcholine receptors. (See Goodman and Gilman's, The Pharmacological Basis of Therapeutics, op. cit.).

The responses of these receptor subtypes are mediated by two entirely different 25 classes of second messenger systems. When the nicotinic acetylcholine receptor is activated, the response is an increased flux of specific extracellular ions (e.g.  $\text{Na}^+$ ,  $\text{K}^+$  and  $\text{Ca}^{++}$ ) through the neuronal membrane. In contrast, muscarinic acetylcholine receptor activation leads to changes in intracellular systems that contain complex molecules such as G-proteins and inositol phosphates. Thus, the biological consequences of nicotinic 30 acetylcholine receptor activation are distinct from those of muscarinic receptor activation. In an analogous manner, inhibition of nicotinic acetylcholine receptors results in still other biological effects, which are distinct and different from those arising from muscarinic receptor inhibition.

As indicated above, the two principal sites to which drug compounds that affect 35 chemical synaptic transmission may be directed are the presynaptic nerve terminal and the postsynaptic membrane. Actions of drugs directed to the presynaptic site may be mediated through presynaptic receptors that respond to the neurotransmitter which the same secreting structure has released (i.e., through an autoreceptor), or through a presynaptic receptor that responds to another neurotransmitter (i.e., through a heteroreceptor). Actions of drugs directed to the postsynaptic membrane mimic the action of the endogenous neurotransmitter or inhibit the interaction of the endogenous neurotransmitter with a postsynaptic receptor.

Classic examples of drugs that modulate postsynaptic membrane excitability are the neuromuscular blocking agents which interact with nicotinic acetylcholine-gated channel receptors on skeletal muscle, for example, competitive (stabilizing) agents, such as curare, or depolarizing agents, such as succinylcholine.

5 In the central nervous system, postsynaptic cells can have many neurotransmitters impinging upon them. This makes it difficult to know the precise net balance of chemical synaptic transmission required to control a given cell. Nonetheless, by designing compounds that selectively affect only one pre- or postsynaptic receptor, it is possible to modulate the net balance of all the other inputs. Obviously, the more that is understood 10 about chemical synaptic transmission in CNS disorders, the easier it would be to design drugs to treat such disorders.

Knowing how specific neurotransmitters act in the CNS allows one to speculate about the disorders that may be treatable with certain CNS-active drugs. For example, 15 dopamine is widely recognized as an important neurotransmitter in the central nervous systems in humans and animals. Many aspects of the pharmacology of dopamine have been reviewed by Roth and Elsworth, "Biochemical Pharmacology of Midbrain Dopamine Neurons", In: Psychopharmacology: The Fourth Generation of Progress, F.E. Bloom and D.J. Kupfer, Eds., Raven Press, NY, 1995, pp 227-243). Patients with Parkinson's disease have a primary loss of dopamine containing neurons of the nigrostriatal pathway, 20 which results in profound loss of motor control. Therapeutic strategies to replace the dopamine deficiency with dopamine mimetics, as well as administering pharmacologic agents that modify dopamine release and other neurotransmitters have been found to have therapeutic benefit ("Parkinson's Disease", In: Psychopharmacology: The Fourth Generation of Progress, *op. cit*, pp 1479-1484).

25 New and selective neurotransmitter controlling agents are still being sought, in the hope that one or more will be useful in important, but as yet poorly controlled, disease states or behavior models. For example, dementia, such as is seen with Alzheimer's disease or Parkinsonism, remains largely untreatable. Symptoms of chronic alcoholism and nicotine withdrawal involve aspects of the central nervous system, as does the 30 behavioral disorder Attention-Deficit Disorder (ADD). Specific agents for treatment of these and related disorders are few in number or non-existent.

A more complete discussion of the possible utility as CNS-active agents of compounds with activity as cholinergic ligands selective for neuronal nicotinic receptors, (i.e., for controlling chemical synaptic transmission) may be found in U.S. Patent 35 5,472,958, to Gunn et al., issued Dec. 5, 1995, which is incorporated herein by reference.

Existing acetylcholine agonists are therapeutically sub-optimal in treating the conditions discussed above. For example, such compounds have unfavorable pharmacokinetics (e.g., arecoline and nicotine), poor potency and lack of selectivity (e.g., nicotine), poor CNS penetration (e.g., carbachol) or poor oral bioavailability (e.g., nicotine). In addition, other agents have many unwanted central agonist actions, including hypothermia, hypolocomotion and tremor and peripheral side effects, including miosis, lachrymation, defecation and tachycardia (Benowitz *et al.*, in: Nicotine Psychopharmacology, S. Wonnacott, M.A.H. Russell, & I.P. Stolerman, eds., Oxford University Press, Oxford, 1990, pp. 112-157; and M. Davidson, *et al.*, in Current Research in Alzheimer Therapy, E. Giacobini and R. Becker, ed.; Taylor & Francis: New York, 1988; pp 333-336).

Various heterocyclic 2-pyrrolidinyloxy-substituted compounds with analgesic and hypotensive activities have been disclosed by Scheffler *et al.* (U.S. Patent 4,643,995) and Tomioka *et al.* (*Chem. Pharm. Bull.*, 38:2133-5, 1990).

15 Certain other 2-pyridyloxy-substituted compounds are disclosed *inter alia* by Engel *et al.* in U.S. Patent 4,946,836 as having analgesic activity.

Various other compounds having a pyrrolidine or azetidine moiety substituted at the 3-position with a heterocycloxy group have also been disclosed (*cf.* U.S. Patents 4,592,866 to A.D. Cale; 4,705,853 to A.D. Cale; 4,956,359 to Taylor *et al.*; and 5,037,841 to 20 Schoehe *et al.* and European patent application EP296560A2, to Sugimoto *et al.*).

Certain nicotine-related compounds having utility in enhancing cognitive function have been reported by Lin in U.S. Patent 5,278,176, issued Jan. 11, 1994. Also, 2-(nitro)phenoxy compounds with similar function have been reported by Gunn *et al.*, U.S. Patent 5,472,958, issued Dec. 5, 1995.

25 In the PCT Patent Application WO94 08992 of Abreo *et al.*, published April 28, 1994, are disclosed, *inter alia*, various 3-pyridyloxy-heterocyclic compounds that are either unsubstituted or mono-substituted on the pyridine ring with groups such as Br, Cl, F, hydroxyl, C<sub>1</sub>-C<sub>3</sub>-alkyl or C<sub>1</sub>-C<sub>3</sub>-alkoxy, such compounds also described as having utility in enhancing cognitive function.

Definitions

The terms "C<sub>1</sub>-C<sub>3</sub>-alkyl," "C<sub>1</sub>-C<sub>4</sub>-alkyl," or "C<sub>1</sub>-C<sub>6</sub>-alkyl" as used herein refer to saturated, straight- or branched-chain hydrocarbon radicals containing between one and three or one and six carbon atoms, respectively. Examples of C<sub>1</sub>-C<sub>4</sub>-alkyl radicals include, 20 but are not limited to, methyl, ethyl, propyl, isopropyl, *n*-butyl and *t*-butyl. Examples of C<sub>1</sub>-C<sub>3</sub> alkyl radicals include methyl, ethyl, propyl and isopropyl, examples of C<sub>1</sub>-C<sub>6</sub>-alkyl radicals include, but are not limited to, methyl, ethyl, propyl, isopropyl, *n*-butyl, *t*-butyl, neopentyl, *n*-hexyl.

The term "C<sub>1</sub>-C<sub>3</sub>-alkoxy" as used herein refers to an C<sub>1</sub>-C<sub>3</sub>-alkyl group, as 25 previously defined, attached to the parent molecular moiety through an oxygen atom. Examples of C<sub>1</sub>-C<sub>3</sub>-alkoxy, but are not limited to, methoxy, ethoxy, propoxy and isopropoxy.

One or more asymmetric centers may exist in the compounds of the present invention. Except where otherwise noted, the present invention contemplates the various 30 stereoisomers and mixtures thereof.

As used herein, the term "pharmaceutically acceptable salt" refers to those salts which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically 35 acceptable salts are well known in the art. For example, S. M. Berge, *et al.* describe pharmaceutically acceptable salts in detail in *J. Pharmaceutical Sciences*, 66: 1-19 (1977), incorporated herein by reference. The salts can be prepared *in situ* during the final

## 18

isolation and purification of the compounds of the invention, or separately by reacting the free base function with a suitable organic acid. Examples of pharmaceutically acceptable, nontoxic acid addition salts are salts of an amino group formed with inorganic acids such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulfuric acid and perchloric acid or with organic acids such as acetic acid, oxalic acid, maleic acid, tartaric acid, citric acid, succinic acid or malonic acid or by using other methods used in the art such as ion exchange. Other pharmaceutically acceptable salts include adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptonate, glycerophosphate, gluconate, hemisulfate, heptanoate, hexanoate, hydroiodide, 2-hydroxy-ethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pamoate, pectinate, persulfate, 3-phenylpropionate, phosphate, picrate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, *p*-toluenesulfonate, undecanoate, valerate salts, and the like. Representative alkali or alkaline earth metal salts include sodium, lithium, potassium, calcium, magnesium, and the like. Further pharmaceutically acceptable salts include, when appropriate, nontoxic ammonium, quaternary ammonium, and amine cations formed using counterions such as halide, hydroxide, carboxylate, sulfate, phosphate, nitrate, loweralkyl sulfonate and aryl sulfonate.

The term "prodrug" refers to compounds that are rapidly transformed *in vivo* to yield the parent compounds of Formula (I), as for example, by hydrolysis in blood. T. Higuchi and V. Stella provide a thorough discussion of the prodrug concept in Prodrugs as Novel Delivery Systems, Vol. 14 of the A.C.S. Symposium Series, American Chemical Society (1975). Examples of esters useful as prodrugs for compounds containing carboxyl groups may be found on pages 14-21 of Bioreversible Carriers in Drug Design: Theory and Application, edited by E.B. Roche, Pergamon Press (1987).

The term "prodrug ester group" refers to any of several ester-forming groups that are hydrolyzed under physiological conditions. Examples of prodrug ester groups include pivoxyloxymethyl, acetoxyethyl, phthalidyl, indanyl and methoxymethyl, as well as other such groups known in the art.

As used herein, the term "pharmaceutically acceptable ester" refers to esters which hydrolyze *in vivo* and include those that break down readily in the human body to leave the parent compound or a salt thereof. Suitable ester groups include, for example, those derived from pharmaceutically acceptable aliphatic carboxylic acids, particularly alcanoic, alkenoic, cycloalkanoic and alkanedioic acids, in which each alkyl or alkenyl moiety

## 19

advantageously has not more than 6 carbon atoms. Examples of particular esters includes formates, acetates, propionates, butryates, acrylates and ethylsuccinates.

Abbreviations

5 Abbreviations which have been used in the descriptions of the scheme and the examples that follow are: BOC for t-butyloxycarbonyl; Et<sub>2</sub>O for diethyl ether; EtOAc for ethyl acetate; DEAD for diethylazodicarboxylate; DMAP for 4-dimethylaminopyridine; DMF for dimethyl formamide; DPPA for diphenylphosphoryl azide; EDC for 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide HCl; EtOAc for ethyl acetate; MeOH for 10 methanol; Na(TMS)<sub>2</sub> for sodium bis(trimethylsilyl)amide; NMMO for N-methylmorpholine N-oxide; Ph for phenyl; TEA for triethylamine; TFA for trifluoroacetic acid; THF for tetrahydrofuran; TPP for triphenylphosphine.

Pharmaceutical Compositions

15 The pharmaceutical compositions of the present invention comprise a therapeutically effective amount of a compound of the present invention formulated together with one or more pharmaceutically acceptable carriers. As used herein, the term "pharmaceutically acceptable carrier" means a non-toxic, inert solid, semi-solid or liquid filler, diluent, encapsulating material or formulation auxiliary of any type. Some examples of materials 20 which can serve as pharmaceutically acceptable carriers are sugars such as lactose, glucose and sucrose; starches such as corn starch and potato starch; cellulose and its derivatives such as sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; powdered tragacanth; malt; gelatin; talc; excipients such as cocoa butter and suppository waxes; oils such as peanut oil, cottonseed oil; safflower oil; sesame oil; olive oil; corn oil and soybean 25 oil; glycols; such a propylene glycol; esters such as ethyl oleate and ethyl laurate; agar; buffering agents such as magnesium hydroxide and aluminum hydroxide; alginic acid; pyrogen-free water; isotonic saline; Ringer's solution; ethyl alcohol, and phosphate buffer solutions, as well as other non-toxic compatible lubricants such as sodium lauryl sulfate and magnesium stearate, as well as coloring agents, releasing agents, coating agents; 30 sweetening, flavoring and perfuming agents, preservatives and antioxidants can also be present in the composition, according to the judgment of the formulator. The pharmaceutical compositions of this invention can be administered to humans and other animals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments, or drops), buccally, or as an oral or nasal spray.

35 Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in

## 20

the art such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethylformamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils), glycerol, 5 tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof. Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

10 Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution, suspension or emulsion in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, U.S.P. and 15 isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil can be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid are used in the preparation of injectables.

## 20

The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium prior to use.

25 In order to prolong the effect of a drug, it is often desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the drug then depends upon its rate of dissolution which, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed 30 absorption of a parenterally administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle. Injectable depot forms are made by forming microencapsule matrices of the drug in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of drug to polymer and the nature of the particular polymer employed, the rate of drug release can be controlled. Examples of 35 other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the drug in liposomes or microemulsions which are compatible with body tissues.

## 21

Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating excipients or carriers such as cocoa butter, polyethylene glycol or a suppository wax which are solid at ambient temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is mixed with at least one inert, pharmaceutically acceptable excipient or carrier such as sodium citrate or dicalcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, glucose, 10 mannitol, and silicic acid, b) binders such as, for example, carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidinone, sucrose, and acacia, c) humectants such as glycerol, d) disintegrating agents such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate, e) solution retarding agents such as paraffin, f) absorption accelerators such as quaternary ammonium compounds, g) 15 wetting agents such as, for example, cetyl alcohol and glycerol monostearate, h) absorbents such as kaolin and bentonite clay, and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

20 Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings and other coatings well known in 25 the pharmaceutical formulating art. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions which can be used include polymeric substances and waxes.

30 Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

The active compounds can also be in micro-encapsulated form with one or more excipients as noted above. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings, release 35 controlling coatings and other coatings well known in the pharmaceutical formulating art. In such solid dosage forms the active compound may be admixed with at least one inert diluent such as sucrose, lactose or starch. Such dosage forms may also comprise, as is

## 22

normal practice, additional substances other than inert diluents, e.g., tableting lubricants and other tableting aids such as magnesium stearate and microcrystalline cellulose. In the case of capsules, tablets and pills, the dosage forms may also comprise buffering agents. They may optionally contain opacifying agents and can also be of a composition that they

5 release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions which can be used include polymeric substances and waxes.

Dosage forms for topical or transdermal administration of a compound of this invention include ointments, pastes, creams, lotions, gels, powders, solutions, sprays, 10 inhalants or patches. The active component is admixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives or buffers as may be required. Ophthalmic formulation, ear drops, eye ointments, powders and solutions are also contemplated as being within the scope of this invention.

The ointments, pastes, creams and gels may contain, in addition to an active 15 compound of this invention, excipients such as animal and vegetable fats, oils, waxes, paraffins, starch, tragacanth, cellulose derivatives, polyethylene glycols, silicones, bentonites, silicic acid, talc and zinc oxide, or mixtures thereof.

20 Powders and sprays can contain, in addition to the compounds of this invention, excipients such as lactose, talc, silicic acid, aluminum hydroxide, calcium silicates and polyamide powder, or mixtures of these substances. Sprays can additionally contain customary propellants such as chlorofluorohydrocarbons.

Transdermal patches have the added advantage of providing controlled delivery of a 25 compound to the body. Such dosage forms can be made by dissolving or dispersing the compound in the proper medium. Absorption enhancers can also be used to increase the flux of the compound across the skin. The rate can be controlled by either providing a rate controlling membrane or by dispersing the compound in a polymer matrix or gel.

According to the methods of treatment of the present invention, disorders in 30 synaptic transmission are treated or prevented in a patient such as a human or lower mammal by administering to the patient a therapeutically effective amount of a compound of the invention, in such amounts and for such time as is necessary to achieve the desired result. By a "therapeutically effective amount" of a compound of the invention is meant a sufficient amount of the compound to treat disorders in synaptic transmission, at a 35 reasonable benefit/risk ratio applicable to any medical treatment. It will be understood, however, that the total daily usage of the compounds and compositions of the present invention will be decided by the attending physician within the scope of sound medical

## 23

judgment. The specific therapeutically effective dose level for any particular patient will depend upon a variety of factors including the disorder being treated and the severity of the disorder; the activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed; and like factors well known in the medical arts.

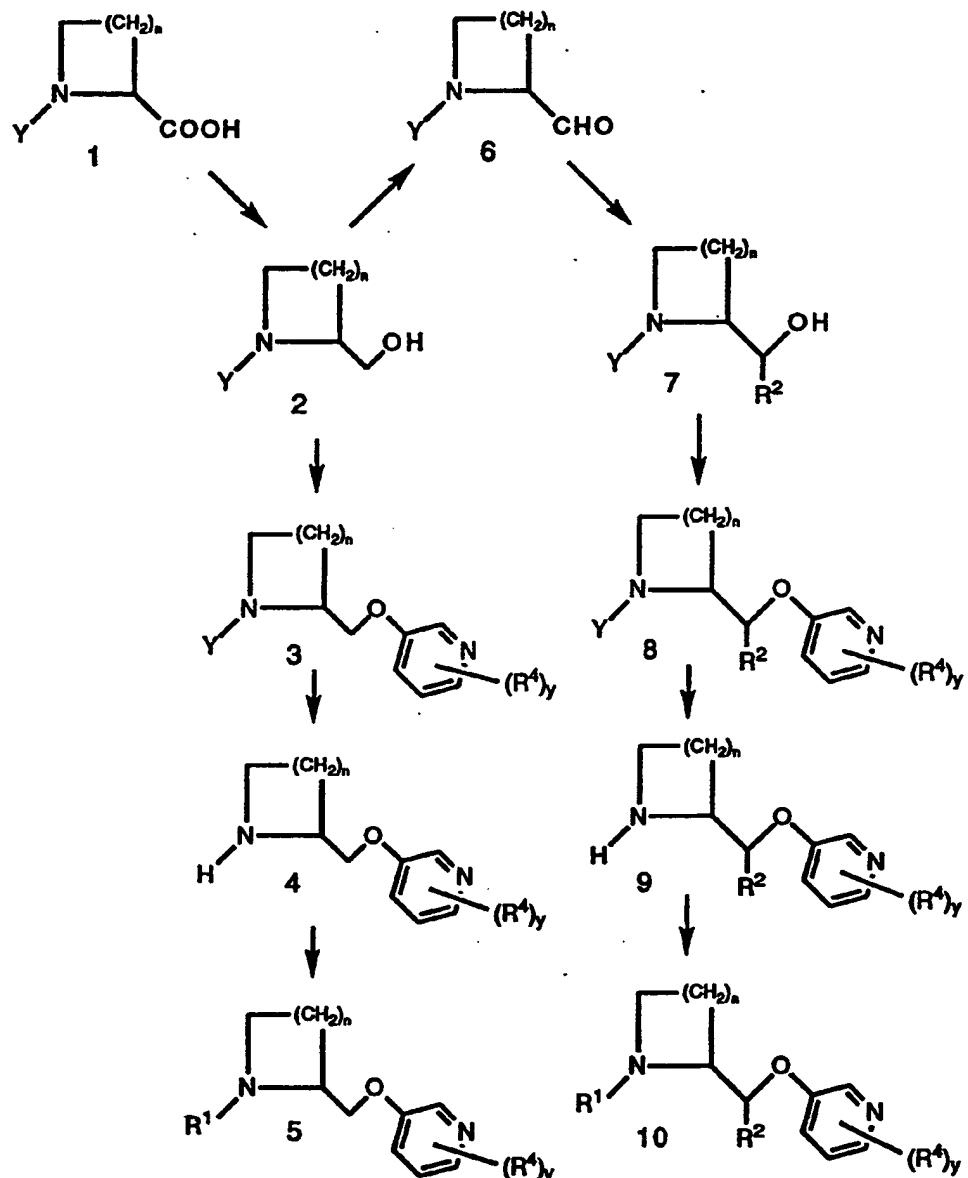

Therapeutic Administration

10 The total daily dose of the compounds of this invention administered to a human or other mammal in single or in divided doses can be in amounts, for example, from 0.001 to 50 mg/kg body weight or more usually from 0.01 to 25 mg/kg body weight. Single dose compositions may contain such amounts or submultiples thereof to make up the daily dose. In general, treatment regimens according to the present invention comprise administration 15 to a patient in need of such treatment from about 1 mg to about 1000 mg of the compound(s) of this invention per day in single or multiple doses.

Synthetic Methods

20 The compounds and processes of the present invention will be better understood in connection with the following synthetic schemes which illustrate the methods by which the compounds of the invention may be prepared. The groups n, y, R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and R<sup>4</sup> are as defined above unless otherwise noted.

24

5 In accordance with reaction Scheme 1, compounds of Formula (I) are prepared by reacting a 2-carboxyl-substituted azacycloalkyl compound (1), wherein n is as described above, R<sup>3</sup> is H and Y is a C<sub>1</sub>-C<sub>3</sub>-alkyl or a suitable protecting group, such as BOC or CBZ, for example, which may subsequently be removed and replaced with H, allyl, or C<sub>1</sub>-C<sub>3</sub>-alkyl, is converted to the hydroxymethyl compound of formula (2) with a suitable

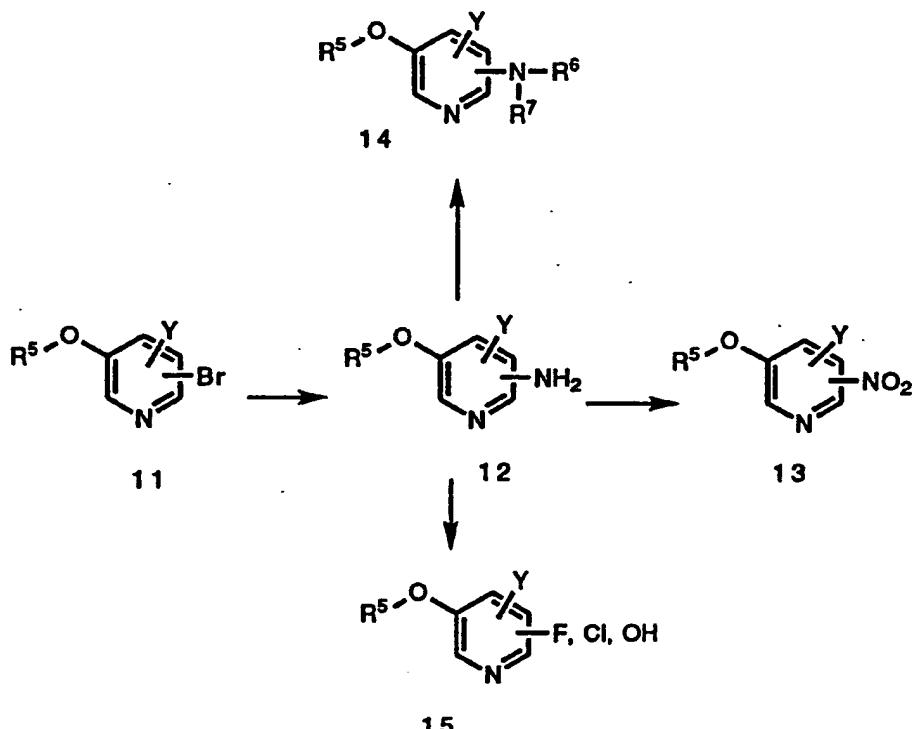

## 25

reducing agent, such as Red-Al®, borane/THF, borane/methyl sulfide or LiAlH<sub>4</sub>, for example. Compound (2) is reacted with an appropriately substituted 3-hydroxypyridine compound, wherein R<sup>4</sup> is as described above or is an appropriately protected R<sup>4</sup> group (wherein the protecting group may be removed after the coupling reaction), in the presence 5 of triphenylphosphine and DEAD as described by O. Mitsunobu (*Synthesis*, 1981: 1) to form the pyridine compound of formula (3). This compound is then treated with a reagent suitable for removing the N-protecting group, such as trifluoroacetic acid for BOC removal, HCl in ethanol for CBZ removal, HBr in acetic acid, or hydrogenolysis with hydrogen in the presence of a noble metal catalyst, to form the unprotected compound (4), which is a 10 compound of Formula (I) above. The ring nitrogen may then be alkylated, for example, by treatment with alkyl halide in the presence of a base, formaldehyde in formic acid, or with an aldehyde and sodium cyanoborohydride in an alcohol solvent, such as methanol, ethanol or isopropanol, or by reaction with the appropriate alkylating reagent, such as, for example, allyl bromide, to give the desired compound (5), wherein R<sup>1</sup> is as described above.

15 Alternately, compound (2) may be oxidized using a suitable mild oxidizing agent such as DMSO/pyridine-SO<sub>3</sub>, pyridinium chlorochromate or DMSO/oxalyl chloride, for example, to afford the aldehyde (6). The aldehyde is then reacted with a suitable organometallic nucleophile, for example, a Grignard reagent, to afford the alcohol (7), wherein R<sup>2</sup> is as described above. The alcohol is then reacted as described above with a 3- 20 hydroxypyridine and carried through the same series of reactions as described above, starting with compound (2) and leading to compounds (3), (4) and (5), to give the compounds (8), (9) and (10), wherein R<sup>1</sup> is as described above.

## 26

### Scheme 2

5 In accordance with Scheme 2, compounds (11), which may be either protected pyridine compounds wherein R<sup>5</sup> is a protecting group or the conjugated compounds of formulas (5) or (10) above, and Y may be hydrogen or a suitable group selected by one skilled in the art, may be utilized as starting materials to prepare various compounds of Formula (I) wherein R<sup>4</sup> represents different chemical moieties. For example, compound 10 (11) may be reacted with NH<sub>3</sub> by heating in an alcoholic solvent, such as methanol, ethanol, propanol, i-propanol, t-butanol or the like, preferably in the presence of Cu<sup>2+</sup> as a catalyst to give the compound (12).

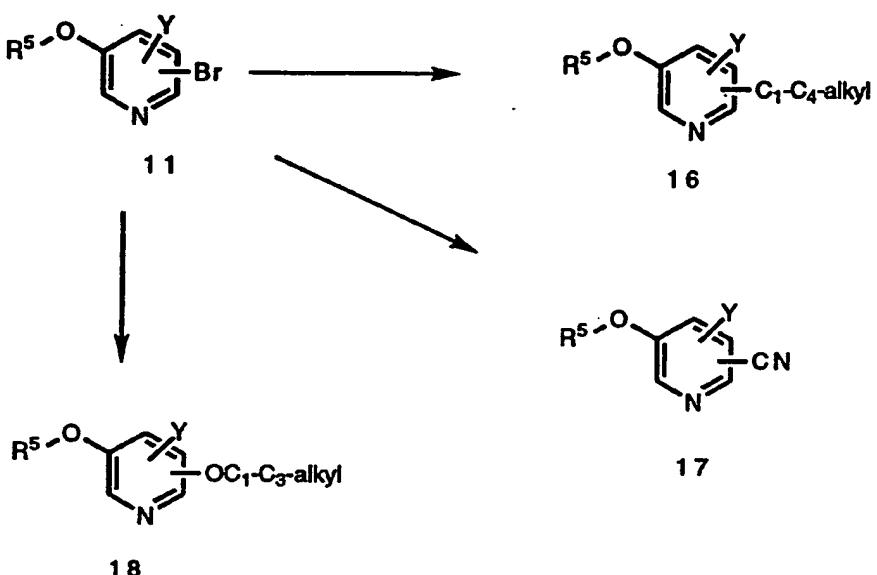

15 In turn, compound (12) may be used to generate additional functionally substituted compounds. For example, compound (12) may be treated with potassium persulfate and sulfuric acid to oxidize the amino group to a nitro group and prepare compound (13). Or, compound (12) may be treated with R<sup>6</sup>-X or R<sup>7</sup>-X, wherein R<sup>6</sup> and R<sup>7</sup> are independently -C<sub>1</sub>-C<sub>3</sub>-alkyl or -CO-C<sub>1</sub>-C<sub>3</sub>-alkyl and X is Cl, to give the appropriately derivatized compounds (14). Alternately, compound (12) may be treated with nitrous acid under diazotizing conditions, then the diazo compound may be reacted with an M-X compound, 20 wherein M is sodium or copper, and X is F or Cl to give selected compounds (15). The

27

intermediate diazo compound may instead be treated with aqueous sulfuric acid to prepare a hydroxy-substituted compound (15). If  $R^5$  is a protecting group, deprotection followed by conjugation as in Scheme 1 gives compounds of Formula (I).

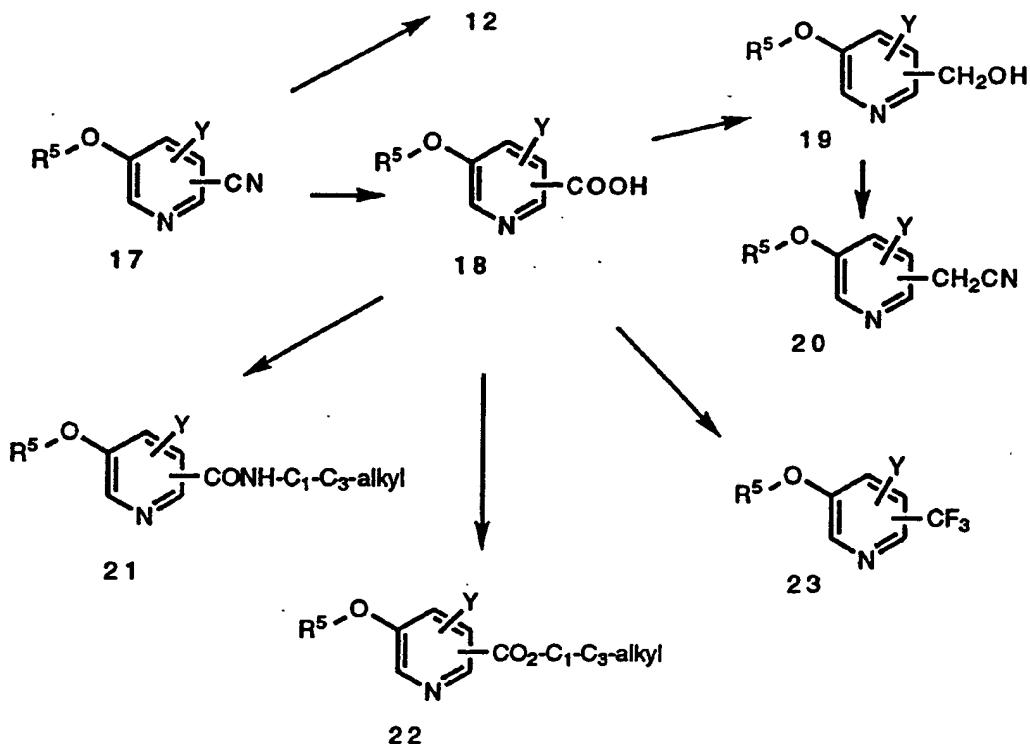

5

Scheme 3

In accordance with Scheme 3 compounds (11), which may be either protected 10 pyridine compounds wherein  $R^5$  is a protecting group or the conjugated compounds of formulas (5) or (10) above, and Y may be hydrogen or a suitable group selected by one skilled in the art, may be utilized as starting materials to prepare various compounds of Formula (I) wherein  $R^4$  is represented by additional chemical moieties. For example, compound (11) may be reacted with a C<sub>1</sub>-C<sub>3</sub>-alkyl-Cu-halide, or alternately, a C<sub>1</sub>-C<sub>3</sub>-alkyl-15 Mg-halide in the presence of a nickel or copper catalyst, or in certain cases, the anion of diethyl malonate followed by hydrolysis and decarboxylation, to give the alkyl-substituted compound (16). Compound (11) may be treated with Zn(CN)<sub>2</sub> in the presence of a Pd catalyst (according to the procedure given by D. M. Tschaen *et al.*, *Synth. Commun.*, 24:887 (1994)) to afford the cyano compound (17). In the event that alkoxy substituent is 20 desired, compound (11) may be reacted with C<sub>1</sub>-C<sub>3</sub>-alkyl-O<sup>-</sup> M<sup>+</sup> salt in heated DMF or a similar dipolar aprotic solvent or in the corresponding C<sub>1</sub>-C<sub>3</sub>-alkanol solvent to give the compound (18).

28  
Scheme 4

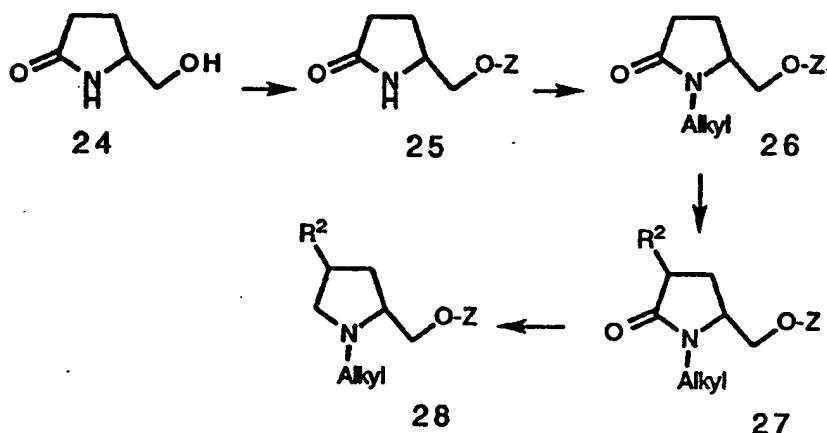

5        In accordance with Scheme 4 the cyano compounds (17), which may be either  
protected pyridine compounds wherein R<sup>5</sup> is a protecting group or the conjugated  
compounds of formulas (5) or (10) above, and Y may be hydrogen or a suitable group  
selected by one skilled in the art, may be utilized as starting materials to prepare various  
compounds of Formula (I) wherein R<sup>4</sup> is represented by additional chemical moieties. For  
10      example, compound (17) may be reacted with H<sub>3</sub>O<sup>+</sup> and the intermediate amide subjected  
to a Hofmann rearrangement to provide an alternate route to compounds (12). Also,  
compound (17) may be converted with H<sub>3</sub>O<sup>+</sup> and heat or NaOH and H<sub>2</sub>O<sub>2</sub> to the  
carboxylic acid compound (18). Reduction of compound (18) with BH<sub>3</sub> or Red-Al<sup>TM</sup>, for  
example, gives compound (19). By treating compound (19) with a reagent to convert the  
15      OH to a leaving group, such as a halo or sulfonate group, then replacing the leaving group  
with CN in a standard nucleophilic reaction, the cyanomethyl compound (20) may be  
prepared. Alternately, treating the acid (18) with an C<sub>1</sub>-C<sub>3</sub>-alkylamine under dehydrating  
conditions allows for preparation of the amide compound (21). Or, reaction of the acid  
(18) with a suitable alcohol, acid catalyst and heat, the ester compound (22) may be  
20      prepared. Another reagent MoF<sub>6</sub> may be reacted with compound (18) by a process similar

29

to that described by Shustov *et al.*, *J. Gen. Chem. USSR* (Engl. Transl.) **53**:85-86 (1983) to prepare compound (23).

Scheme 5

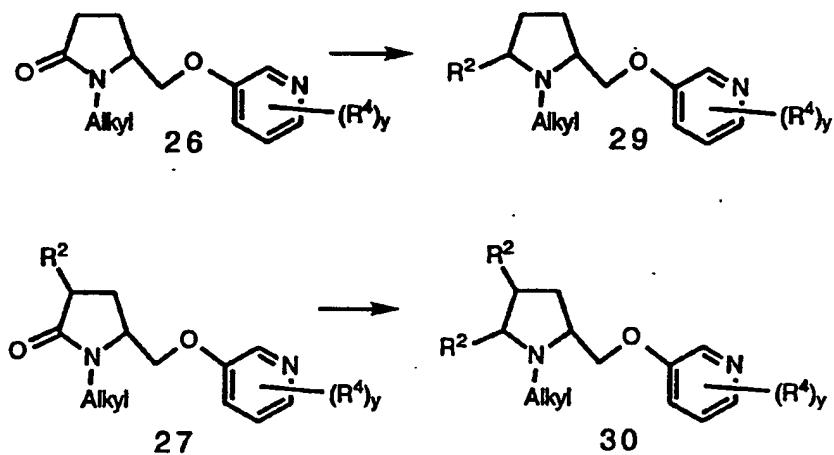

5

In accordance with Scheme 5, the compound (24) may be reacted according to the alternate reaction pathways shown for compounds (2) or (7) in Scheme 1 to give the 10 desired compound (25). In compound (25) Z may represent the pyridine moiety shown in Schemes 1 or may represent a protecting group. Those skilled in the art will recognize that the protecting group may be removed and replaced by the "B" moiety at alternate positions in the synthetic scheme. Such variations in the process will be obvious to skilled practitioners, and exhaustive explanations of the synthetic options are not deemed 15 necessary. The N-alkyl group, wherein the alkyl group is C<sub>1</sub>-C<sub>6</sub>-alkyl, is added to compound (25) by reaction with NaH and the appropriate alkyl iodide in anhydrous THF to give compound (26). Compound (26) is treated with LDA and an electrophile such as an alkyl halide, oxaziridine, formaldehyde, a halomethyl ether, N-halo-succinimide, or molecular halogen, for example, to give the substituted compound (27). In addition, 20 compound (27) wherein R<sup>2</sup> is hydroxy or carboxy may be further reacted with an alkyl halide under standard Williamson ether conditions, acetic anhydride, or methanesulfonyl chloride to give additional precursors to compounds of Formula (I). The methanesulfonate from above (27, R=OMs or CH<sub>2</sub>OMs) may be further reacted with CN<sup>-</sup> or F<sup>-</sup> anions to produce additional precursors to compounds of Formula (I). By reducing the lactam moiety of (27) with BH<sub>3</sub> followed by treatment with CsF, the desired compound (28) is obtained. 25 Conventional use of nitrogen or oxygen protecting groups for achieving selective reactions are included within the processes discussed herein.

30

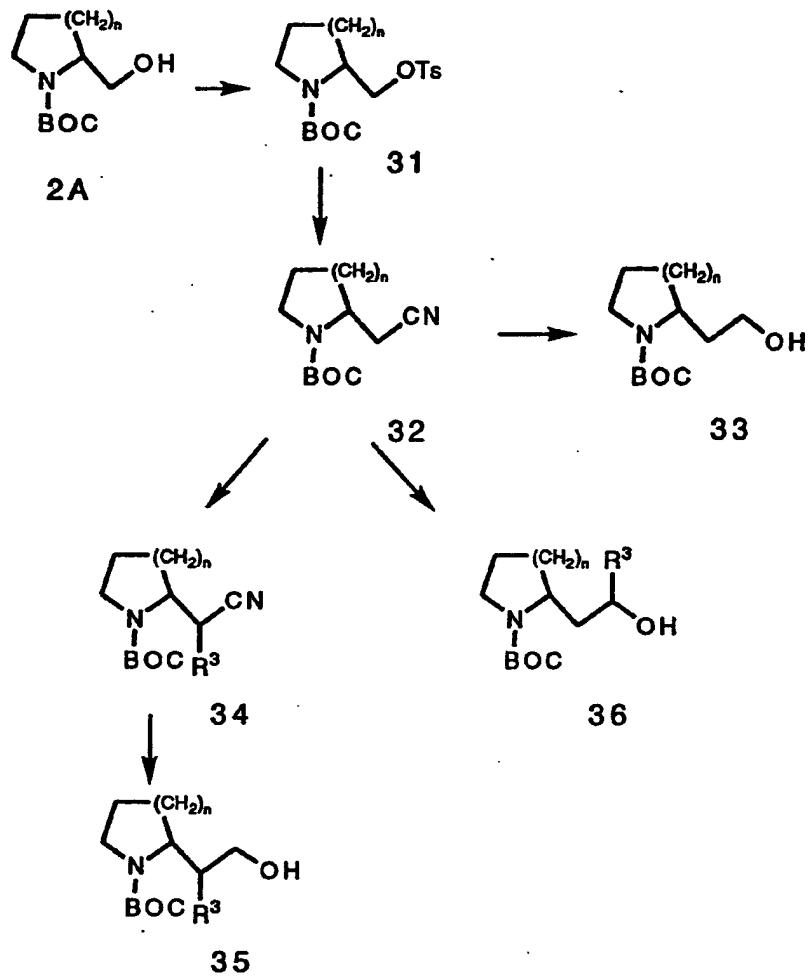

Scheme 6

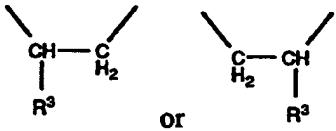

5

In accordance with Scheme 6 are synthesized the compounds of formula (I) wherein R<sup>2</sup> therein represents the appropriate 5-substituent group or the desired 4- and 5-substituent groups as described above, compound (26) is reacted with an C<sub>1</sub>-C<sub>3</sub>-alkyl Grignard reagent followed by NaBH<sub>3</sub>CN to give the compound (29). Compound (27), from Scheme 5 10 wherein Z is as shown above, or a suitably protected derivative, may be further reacted with the appropriate C<sub>1</sub>-C<sub>3</sub>-alkyl Grignard reagent to prepare the disubstituted compound (30).

Scheme 7

5 In accordance with Scheme 7 are prepared compounds of Formula (I) wherein A is

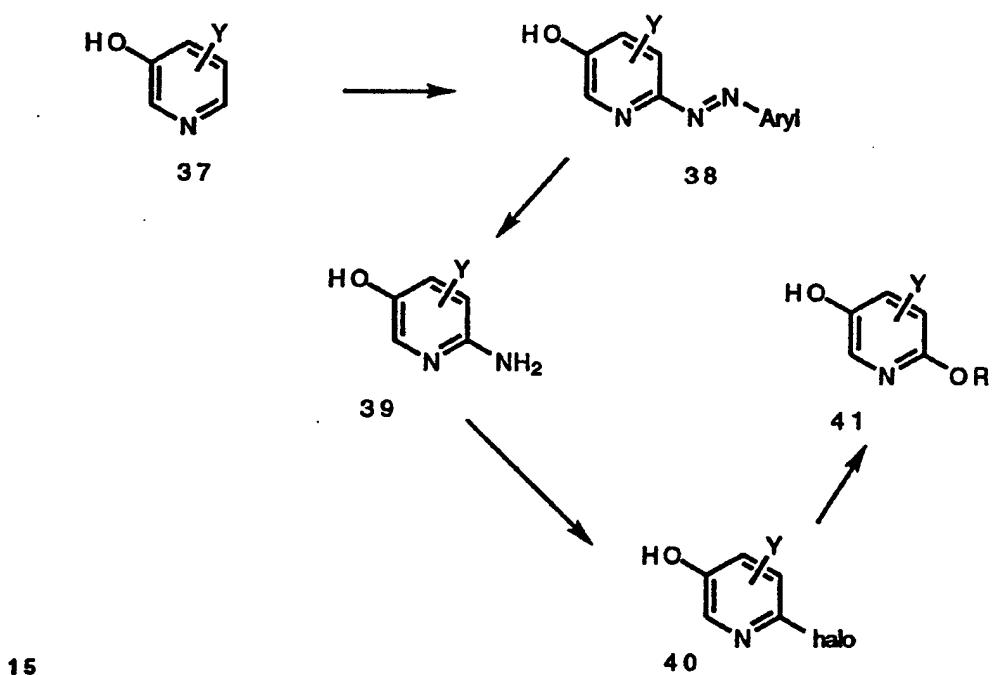

wherein R<sup>3</sup> is as defined above. Compound (2A)

10 (compound 2 of Scheme 1 wherein Y is BOC) is treated with tosyl chloride under standard conditions to prepare the tosylate compound (31). Compound (31) is treated with a cyanide salt in a standard nucleophilic reaction to give the compound (32). Compound (32) may be treated first with methanol and strong acid to hydrolyze the CN group to a methyl ester and the resulting ester is reduced with Li BH<sub>4</sub> or LiAlH<sub>4</sub>, for example, to prepare the alcohol compound (33). Compound (33) may then be substituted for compound (2) or (7)

## 32

of Scheme 1 and carried forward as desired. Alternately, compound (32) may be treated with LDA and  $R^3\text{-X}$ , wherein X is a halogen or other suitable leaving group, to prepare compound (34). Compound (34) may be treated first with methanol and strong acid to convert the CN group to a methyl ester and the resulting ester is reduced with  $\text{LiBH}_4$  or 5  $\text{LiAlH}_4$ , for example, to prepare the alcohol compound (35). In yet another alternate process, compound (32) may be treated with Dibal-H<sup>TM</sup>,  $\text{H}_3\text{O}^+$ , and  $R^3\text{-Mg-X}$  in sequence to prepare the desired alcohol compound (36). Compounds (35) or (36) may then be 10 substituted for compound (2) or (7) of Scheme 1 and carried forward as desired. Compounds (33), (35) and (36) present opportunities for substitution, in accord with the appropriate Schemes above, thus allowing one skilled in the art to prepare other selected compounds of the invention.

Scheme 8

In accordance with Scheme 8 are prepared compounds that may be utilized as starting materials to provide for additional substituted pyridine moieties in selected compounds of the invention. Appropriate substituted compounds (37), wherein Y is a pre-20 existing group selected from  $\text{C}_1\text{-C}_3$  alkyl,  $\text{C}_1\text{-C}_3$  alkoxy, halo, -CN, - $\text{CF}_3$ , - $\text{NO}_2$ , - $\text{CH}_2\text{OH}$ , - $\text{CH}_2\text{CN}$ , -NH-CHO, - $\text{NHCO(C}_1\text{-C}_3\text{ alkyl)}$ , - $\text{N(C}_1\text{-C}_3\text{ alkyl)-CO(C}_1\text{-C}_3\text{ alkyl)}$ , -COOH, - $\text{COO(C}_1\text{-C}_3\text{ alkyl)}$ , -CONH<sub>2</sub>, -CONH-( $\text{C}_1\text{-C}_3$  alkyl), -CONHbenzyl,

## 33

and -OCOC<sub>1</sub>-C<sub>3</sub> alkyl), may be treated with an aryl diazonium compound in the presence of aqueous base to give the diazo compounds (38). Compounds (38) may be reduced by treatment with H<sub>2</sub> and a noble metal catalyst or SnCl<sub>2</sub> to prepare the amino compounds (39). Alternately, treatment of compound (39) with a nucleophilic halide, in the presence of Cu<sup>+</sup> when necessary, allows the preparation of compounds (40). Treatment of compound (40) with a nucleophilic alcohol ROH, allows the preparation of compounds (41).

10 *In vitro Determination of Neuronal Nicotinic Receptor Binding Potencies, Selectivity and Functionality*

For the purpose of identifying compounds as cholinergic agents which are capable of interacting with cholinergic channel receptors in the brain, a ligand-receptor binding assay was carried out as the initial screen. Compounds of the present invention were effective at interacting with neuronal nicotinic cholinergic receptors as assayed *in vitro* for their ability to displace radioligand from neuronal nicotinic cholinergic channel receptors labeled with [<sup>3</sup>H]-cytisine ([<sup>3</sup>H]-CYT) (Protocol A below).

For the purpose of directly evaluating the ability of test compounds to functionally activate or inhibit certain subtypes of neuronal nicotinic cholinergic channels, an assay to determine <sup>86</sup>Rb<sup>+</sup> efflux in IMR-32 cells was employed (Protocol B below).

20 *A. Protocol For Determination of Nicotinic Cholinergic Channel Receptor Binding Potencies of Ligands*

Binding of [<sup>3</sup>H]-cytisine ([<sup>3</sup>H]-CYT) to nicotinic receptors was accomplished using crude synaptic membrane preparations from whole rat brain (Pabreza *et al.*, *Molecular Pharmacol.*, 1990, 39:9). Washed membranes were stored at -80°C prior to use. Frozen aliquots were slowly thawed and resuspended in 20 volumes of buffer (containing: 120 mM NaCl, 5 mM KCl, 2 mM MgCl<sub>2</sub>, 2 mM CaCl<sub>2</sub> and 50 mM Tris-Cl, pH 7.4 @4°C). After centrifuging at 20,000x g for 15 minutes, the pellets were resuspended in 30 volumes of buffer. Homogenate (containing 125-150 µg protein) was added to triplicate tubes containing concentrations of test compound and [<sup>3</sup>H]-CYT (1.25 nM) in a final volume of 500 µL. Samples were incubated for 60 minutes at 4°C, then rapidly filtered through Whatman GF/B filters presoaked in 0.5% polyethylenimine using 3 x 4 mL of ice-cold buffer. The filters are counted in 4 mL of Ecolume® (ICN). Nonspecific binding was determined in the presence of 10 µM (-)-nicotine and values were expressed as a percentage of total binding. IC<sub>50</sub> values were determined with the RS-1 (BBN) nonlinear least squares curve-fitting program and IC<sub>50</sub> values were converted to Ki values using the Cheng and Prusoff correction (Ki=IC<sub>50</sub>/(1+[ligand]/Kd of ligand). Alternately, data were

## 34

expressed as a percentage of the total specific binding. The binding data (shown in Table 1) suggest that the compounds of the present invention have high affinity for the neuronal nicotinic cholinergic channel receptor.

5 **B. Protocols for the Determination of Functional Effects of Cholinergic Channel Receptor Ligands on Synaptic Transmission**

Cells of the IMR-32 human neuroblastoma clonal cell line (ATCC, Rockville, MD) were maintained in a log phase of growth according to established procedures (Lukas, 1993). Experimental cells were seeded at a density of 500,000 cells/mL into a 24-well tissue culture dish. Plated cells were allowed to proliferate for at least 48 hours before loading with 2  $\mu$ Ci/mL of  $^{86}\text{Rb}^+$  (35 Ci/mmol) overnight at 37°C. The  $^{86}\text{Rb}^+$  efflux assays were performed according to previously published protocols (Lukas, R.J., *J. Pharmacol. Exp. Ther.*, 265: 294-302, 1993) except serum-free Dulbecco's Modified Eagle's Medium was used during the  $^{86}\text{Rb}^+$  loading, rinsing, and agonist-induced efflux steps.

EC<sub>50</sub> data and maximal responses (reported as percent relative to the response elicited by 100  $\mu$ M (S)-nicotine) are shown for selected compounds of the invention. The inhibition data (given for other selected compounds) reflect inhibition of the efflux elicited by 100  $\mu$ M (S)-nicotine for either a single dose (% inhibition at 1 or 10  $\mu$ M) or over a range of doses (IC<sub>50</sub> of inhibition). The results (also shown in Table 1) suggest that selected compounds of the present invention either activate or inhibit the initial ion flux aspects of synaptic transmission mediated by neuronal nicotinic acetylcholine receptors. This finding is in agreement with the results of others who have linked dopamine release, which is dependent upon the ion flux in synaptic transmission, to binding at nicotinic receptors (cf., for example, Lippiello and Caldwell, U.S. Patent 5,242,935, issued Sept. 7, 1993; Caldwell and Lippiello, U.S. Patent 5,248,690, issued Sept. 28, 1993; and Wonnacott *et al.*, *Prog. Brain Res.*, 79: 157-163 (1989)).

Preparations of Starting Materials

Several starting materials are used repeatedly throughout the examples that follow.

1-Methyl-2-(S)-pyrrolidinemethanol was obtained from Aldrich Chemical Co. 1-Methyl-2-(R)-pyrrolidinemethanol was obtained from Fluka.

10 In the PCT Patent Application WO94 08992 of Abreo *et al.*, published April 28, 1994, and in Abreo, *et al. J. Med Chem.*, 39, 817-825 (1996), are disclosed methods for preparing, *inter alia*, the (R) and (S) 1-BOC-2-(S)-pyrrolidinemethanol compounds, the (R) and (S) 1-BOC-2-(S)-azetidinemethanol compounds, and 1-Cbz-2-(R)-azetidinemethanol. 1-Cbz-2-(S)-azetidinemethanol is prepared from 2-(S)-azetidinecarboxylic acid using 15 analogous procedures.

Example 15-Ethylamino-3-(1-methyl-2-(S)-pyrrolidinylmethoxy)pyridine hydrochlorideStep 1a. 5-bromo-3-((1-methyl-2-(S)-pyrrolidinyl)methoxy)pyridine

20 (S)-1-Methyl-2-pyrrolidinemethanol (Aldrich Chemical Co., 4.96 g, 40.0 mmol) was carefully added to a suspension of sodium hydride (1.32 g, 80% yield, 44.0 mmol) in anhydrous DMF (100 mL). After stirring at room temperature for 0.5 hour, 3,5-dibromopyridine (4.83 g, 20.0 mmol) was added, and the reacting mixture was stirred at 50°C for 4 hours. After cooling, 5.0 mL of water was added, and the solvents were 25 removed under reduced pressure. Additional water (5.0 mL) was added, and the slurry was washed extensively with EtOAc (4X40 mL). The combined organic layers were dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated. The crude product was purified by flash chromatography on silica gel eluting with CHCl<sub>3</sub>/MeOH (10:1) to provide 4.50 g (83% yield) of the title compound. TLC R<sub>f</sub> 0.33 (10:1 CHCl<sub>3</sub>/MeOH). MS (DCI/NH<sub>3</sub>) m/z 271, 273 (M+H)<sup>+</sup>. 30 <sup>1</sup>H NMR (CDCl<sub>3</sub>, 300 MHz) δ 8.37 (d, J = 1.8 Hz, 1H), 8.26 (d, J = 2.7 Hz, 1H), 7.39 (dd, J = 1.8, 2.7 Hz, 1H), 4.01 (dd, J = 3.3, 11.1 Hz, 1H), 3.93 (dd, J = 6.9, 11.1 Hz, 1H), 3.15 (m, 1H), 2.69 (m, 1H), 2.49 (s, 3H), 2.34 (m, 1H), 2.44-2.00 (m, 4H).

Step 1b. 5-Amino-3-(1-methyl-2(S)-pyrrolidinylmethoxy)pyridine

35 To a solution of the compound of example 1a (3 g, 11.1 mmol) in methanol (125 mL) was added CuBr (1.38 g). The resultant mixture was allowed to stir with ammonia at 130°C in a pressure vessel for 24 hours. The excess ammonia was evaporated, methanol was removed, and the resultant residue was dissolved in water. The aqueous solution was

then extracted with chloroform (3x50 mL). The combined organic layers were dried over anhydrous MgSO<sub>4</sub> and filtered. The mixture was concentrated *in vacuo* and the residue was purified on silica gel to give 2.0 g (86%) of the title compound. MS (DCI/NH<sub>3</sub>) m/e: 208 (M+H)<sup>+</sup>. <sup>1</sup>H NMR (CDCl<sub>3</sub>, 300 MHz) δ 7.77 (d, 1H, J= 3.0 Hz), 7.72 (d, 1H, J= 3.0 Hz), 6.54 (t, 1H, J= 3.0 Hz), 4.00-3.85 (m, 2H), 3.66 (m, 1H), 3.10 (m, 1H), 2.64 (m, 1H), 2.47 (s, 3H), 2.30 (m, 1H), 2.02 (m, 1H), 1.54-1.90 (m, 2H).

**Step 1c. 5-Acetamido-3-(1-methyl-2-(S)-pyrrolidinylmethoxy)pyridine**

To neat 5-amino-3-(1-methyl-2-(S)-pyrrolidinylmethoxy)pyridine (from step 1b) was added excess acetic anhydride (2mL) at room temperature, and the reaction mixture was stirred at 60 °C for 18 h. Judged by TLC, a substantial amount of starting material remained. A catalytic amount of dimethylaminopyridine was then added to the reaction mixture and the resultant solution was allowed to stir for an additional 24 h. Methylene chloride was added to the reaction mixture followed by the addition of saturated sodium bicarbonate solution. The organic layer was separated, evaporated *in vacuo*, and the residue was chromatographed on a silica gel column, eluting with CHCl<sub>3</sub>/MeOH, 10:1, to afford an oil (88 mg, 68%). MS (CI/NH<sub>3</sub>) m/z 250 (M+H)<sup>+</sup>. <sup>1</sup>H NMR (CDCl<sub>3</sub> 300 MHz) δ 1.66-1.90 (m, 3H), 2.04 (m, 1H), 2.22 (s, 3H), 2.31 (m, 1H), 2.48 (s, 3H), 2.66 (m, 1H), 3.12 (m, 1H), 3.93-4.05 (m, 2H), 7.93 (m, 1H), 8.03 (d, J = 2.9 Hz, 1H), 8.08 (d, J = 2.9 Hz, 1H).

**Step 1d. 5-Ethylamino-3-(1-methyl-2-(S)-pyrrolidinylmethoxy)pyridine dihydrochloride**

The product from step 1c above (540 mg, 2.17 mmol) in tetrahydrofuran (5 mL) was treated dropwise with a 1M solution of borane (6.50 mL, 6.50 mmol) in tetrahydrofuran at room temperature. After reflux for 15 h, the reaction was quenched by addition of a large excess of methanol. The resultant solution was allowed to stir at room temperature for an additional 1 h. Solvent was then removed under reduced pressure to give a white solid. The crude reaction product was dissolved in ethanol and treated with excess cesium fluoride. The organic solvent was removed under reduced pressure. The crude product was purified by flash column chromatography on silica gel eluting with CHCl<sub>3</sub>/MeOH (10:1) to give 120 mg of the title compound (407 mg, 80%) as a colorless oil. MS(DCI/NH<sub>3</sub>) m/z 236 (M+H)<sup>+</sup>. <sup>1</sup>H NMR(CDCl<sub>3</sub>) δ 1.27 (t, J=7.5 Hz, 3H), 1.54-1.94 (m, 4H), 2.02 (m, 1H), 2.31 (m, 1H), 2.48 (s, 3H), 3.08-3.20 (m, 3H), 3.60 (m, 1H), 3.91 (dd, J = 6.0, 10 Hz, 1H), 4.01 (dd, J = 6.0, 10 Hz, 1H), 6.43 (t, J= 3.0 Hz, 1H), 7.66 (d, J = 3.0 Hz, 1H), 7.68 (d, J = 3.0 Hz, 1H).

To the solution of the product obtained above in diethyl ether (1.5 mL) was added hydrogen chloride in diethyl ether dropwise at 0°C. After stirring at 0°C for 15 minutes, the precipitate was collected by centrifugation, washed with diethyl ether three times and dried *in vacuo* to yield the title compound as a white powder. mp 190-192°C. ## Example 2

5-Bromo-6-chloro-3-(2-(S)-azetidinylmethoxy)pyridine hydrochlorideStep 2a. 5-Bromo-6-chloro-3-(1-BOC-2-(S)-azetidinylmethoxy)pyridine

10 To a solution of diethyl azodicarboxylate (1.52 mL, 9.6 mmol) in THF (56 mL) was added triphenylphosphine (2.52 g, 9.6 mmol) at 0°C, and the reaction mixture was stirred for 0.5 hour. 1-BOC-2-(S)-azetidinemethanol (1.44 g, 7.7 mmol) and 5-bromo-6-chloropyridin-3-ol (1.4 g, 6.4 mmol; prepared from 2-hydroxy-5-nitropyridine according to V. Koch and S. Schnatterer, *Synthesis* 1990, 499-501) were then added. The reaction mixture was allowed to warm slowly to room temperature and stir overnight. Solvent was removed, and the residue was chromatographed on a silica gel column, eluting with chloroform:methanol (100:1) to afford the title compound. MS (DCI/NH<sub>3</sub>) m/z 377, 379 (M+H)<sup>+</sup>.

20 To 5-bromo-6-chloro-3-(1-BOC-2-(S)-azetidinylmethoxy)pyridine from step 2a (360 mg, 0.95 mmol) was added TFA in methylene chloride at 0°C, and the mixture was stirred for 30 minutes. The volatile components were then removed under vacuum. The residue was neutralized with NaHCO<sub>3</sub>, then extracted with methylene chloride, which was dried over MgSO<sub>4</sub> and concentrated. The residue was chromatographed on a silica gel column, eluting with methylene chloride:methanol:NH<sub>4</sub>OH 10:1:0.1 to afford to give the free base of the title compound. The base was converted to the salt by treatment with hydrogen chloride in ether to give the title compound (224 mg). mp 168-169°C. ## Example 3

5-Bromo-6-chloro-3-(1-methyl-2-(S)-azetidinylmethoxy)pyridine hydrochloride

35 A sample of 5-bromo-6-chloro-3-(2-(S)-azetidinylmethoxy)pyridine (from Example 2b, 140 mg, 0.51 mmol) was stirred with excess paraformaldehyde (0.5 mL) in ethanol (3 mL), on ice and under nitrogen at pH 5 (pH adjusted with acetic acid). The reaction was

stirred for 15 minutes and sodium cyanoborohydride (94 mg, 1.5 mmol) was added. A very small amount of bromocresol green was added directly to the reaction mixture as indicator. The reaction was stirred 18 hours, allowed to warm to room temperature, and additional formaldehyde (0.25 mL) and sodium cyanoborohydride (20 mg, 0.32 mmol) 5 were added. The reaction mixture was then acidified to pH 1 with 10% solution of potassium hydrogen sulfate, and the volatile components were evaporated. The aqueous phase was washed with ethyl acetate (3x10 mL), basified with sodium carbonate (pH 9.5), and the products were extracted with ethyl acetate (5x15 mL). These extracts were dried (MgSO<sub>4</sub>), filtered, and concentrated *in vacuo*. The residual oil was purified by flash silica 10 gel chromatography (CHCl<sub>3</sub>:MeOH:NH<sub>4</sub>OH/10:1:0.1), yielding the pure free base (101 mg, 68% yield), which was dissolved in ethanol and converted to the hydrochloride salt by treatment with hydrogen chloride in ethanol to give the title compound. mp 155-157°C (dec). 5-Bromo-6-chloro-3-(2-(S)-pyrrolidinylmethoxy)pyridine dihydrochlorideStep 4a. 5-Bromo-6-chloro-3-(1-BOC-2-(S)-pyrrolidinylmethoxy)pyridine

To a solution of diethyl azodicarboxylate (1.89 mL, 12.0 mmol) in THF (30 mL) 20 was added triphenylphosphine (3.15 g, 12.0 mmol) at 0°C, and the reaction mixture was stirred for 0.5 hour. 1-BOC-(S)-pyrrolidinemethanol (2.41 g, 12.0 mmol) and 5-bromo-6-chloropyridine-3-ol (2.09 g, 10.0 mmol) were then added. The reaction mixture was 25 allowed to warm to room temperature overnight. The solvent was removed, and the residue was chromatographed on a silica gel column, eluting with EtOAc/hexane (1:5 and 1:2) to afford an oil (3.80 g, 97%). To 5-bromo-6-chloro-3-(1-BOC-2-(S)-pyrrolidinylmethoxy)pyridine (from Example 4a, 300 mg, 0.77 mmol) was added formalin (38%, 3.0 mL) and formic acid (88%, 1.5 mL). The mixture was refluxed for 5 hours and cooled to room temperature. Hydrochloric acid (36%, 0.3 mL) was added, and the mixture was extracted with  $Et_2O$  (3 x 8 mL). The aqueous layer was concentrated to dryness under vacuum. Water (2 mL) was added, and solid sodium bicarbonate was added until the aqueous layer was saturated. The mixture was extracted with  $EtOAc$ , which was dried over  $MgSO_4$ , filtered and concentrated. The residue was chromatographed on a silica gel column, eluting with  $CHCl_3/MeOH$  10:1 to afford an oil (214 mg, 91%). Step 6b. 3,5-Dinitropyridine

10 The crude 3,5-dinitro-2-pyridinylhydrazine from step 6a (2.2g, 11.1mmol) and silver acetate (2.2g, 13.2mmol) were dissolved in a mixture of MeOH-H<sub>2</sub>O (1:1). The resultant solution was stirred and heated under reflux overnight. Solvent was evaporated, then water and concentrated ammonia were added to the residue. The aqueous solution was extracted with ethyl ether, dried (MgSO<sub>4</sub>), concentrated and chromatographed (silica gel; hexane/EtOAc, 2:1). An orange solid was obtained (0.40g, 21.8%). MS (CI/NH3) m/z 140 (M-NO)<sup>+</sup>. NMR (CDCl<sub>3</sub>, 300MHz) δ 9.26 (m, 1H), 9.78 (m, 2H).

15 6c. (S)-(1-Methyl-2-pyrrolidinylmethoxy)-5-nitropyridine

16 (S)-1-Methyl-2-pyrrolidinemethanol (0.46ml 3.9mmol) was added to the suspension of NaH (0.16g, 4.0mmol) in DMF. After 30 minutes, 3,5-dinitropyridine (from step 6b, 0.34g, 2.0mmol) in DMF (4ml) was added. The mixture was allowed to stir at room temperature for 3 days. The mixture was diluted with CH<sub>2</sub>Cl<sub>2</sub> (30ml), and washed three times with H<sub>2</sub>O-Brine (1:1). The organic layer was dried (MgSO<sub>4</sub>), concentrated and chromatographed (silica gel: CH<sub>2</sub>Cl<sub>2</sub>/MeOH, 10:0.5). An oil was obtained (70mg, 7.6%). MS (CI/NH3) m/z 238 (M+H)<sup>+</sup>. **Step 15b. 5,6-dichloro-3-(2-(S)-azetidinylmethoxy)pyridine hydrochloride**

To 5,6-dichloro-3-(1-BOC-2-(S)-azetidinylmethoxy)pyridine from step 15a (1.06 g, 3.11 mmol) was added TFA (10 mL) in methylene chloride (10 mL) at 0°C, and the mixture was stirred for 30 minutes. The solution was allowed to warm to room temperature while stirring for an additional 45 minutes. The volatile components were then removed under vacuum. The residue was treated with saturated  $K_2CO_3$  solution, then extracted with methylene chloride, which was dried over  $MgSO_4$  and concentrated. The residue was chromatographed on a silica gel column, eluting with MeOH:CHCl<sub>3</sub>:NH<sub>4</sub>OH (1:10:0 to 1:10:0.05) to afford the free base of the title compound (475 mg, 64% yield). mp 59-60°C. MS (DCI/NH<sub>3</sub>) m/z 233 (M+H)<sup>+</sup>. <sup>1</sup>H NMR (CDCl<sub>3</sub>, 300 MHz)  $\delta$  2.21-2.44 (m, 2H), 3.45 (m, 1H), 3.73 (dd, J=8.4, 15.8 Hz, 1H), 3.98-4.08 (m, 2H), 4.28 (m, 1H), 7.37 (d, J=2.8 Hz, 1H), 8.01 (d, J=2.8 Hz, 1H). The base (336 mg) was slurried in ether and converted to the salt by treatment with saturated HCl in ether to give the title compound. Recrystallization from methanol/ether gave the title compound (317 mg, 81% yield). mp 181-182°C. MS (DCI/NH<sub>3</sub>) m/z 233 (M+H)<sup>+</sup>. <sup>1</sup>H NMR (D<sub>2</sub>O, 300 MHz)  $\delta$  2.65-2.74 (m, 2H), 4.03-4.21 (m, 2H), 4.44 (d, J=4.4 Hz, 1H), 4.95 (m, 1H), 7.79 (d, J=2.9 Hz, 1H), 8.13 (d, J=2.9 Hz, 1H). **Example 16**

**5,6-dichloro-3-(1-methyl-2-(S)-azetidinylmethoxy)pyridine hydrochloride**

A sample of 5,6-dichloro-3-(2-(S)-azetidinylmethoxy)pyridine (from Example 15b, 126 mg, 0.54 mmol) was slurried in 4 mL of H<sub>2</sub>O and acetic acid was added (ca 3 mL) until the solution became homogeneous. An excess of formalin was added, followed by sodium cyanoborohydride until tlc showed consumption of starting material. The reaction mixture was then acidified to pH 1 with HCl, and the mixture was extracted with ether. The aqueous layer was made basic with solid  $K_2CO_3$  and 15% NaOH, and this solution was extracted with methylene chloride. The extract was dried ( $MgSO_4$ ), filtered, and concentrated *in vacuo*. The residue was purified by flash silica gel chromatography (CHCl<sub>3</sub>:MeOH, 20:1), yielding the free base as an oil (105 mg, 79% yield). ## Example 19

3-((cis-1,5-dimethyl-2-(S)-pyrrolidinyl)methoxy)pyridine dihydrochlorideStep 19a. 3-((5-oxo-2-(S)-pyrrolidinyl)methoxy)pyridine

To a solution of triphenylphosphine (52.46 g, 0.20 mol) in 400 mL of anhydrous THF at 0°C was added diethyl azodicarboxylate (31.49 mL, 0.20 mol) dropwise. The mixture was stirred at 0°C for 30 minutes, then brought to room temperature. (S)-5-(Hydroxymethyl)-2-pyrrolidinone (Aldrich Chemical Co., 15.19 g, 0.13 mol) and 3-

hydroxypyridine (19.02 g, 0.20 mol) were added, and the mixture was stirred for 16 hours. Solvent was removed *in vacuo*, then the residue was diluted with CH<sub>2</sub>Cl<sub>2</sub> and washed with 1N NaOH and brine (2X), then dried over MgSO<sub>4</sub> and concentrated. The residue was purified by silica gel flash chromatography using a gradient from 100% CHCl<sub>3</sub> to 10% MeOH/CHCl<sub>3</sub>, then the recovered product was recrystallized from ethyl acetate to give 4.0 g (16%) of the title compound as a white powder. mp 121-122°C. TLC R<sub>f</sub>=0.31 (10%MeOH/CHCl<sub>3</sub>). Step 19b. 3-((1-methyl-5-oxo-2-(S)-pyrrolidinyl)methoxy)pyridine

To a solution of the compound from step 19a above (0.100 g, 0.52 mmol) in anhydrous THF at 0°C was added NaH (80% dispersion, 0.02 g, 0.83 mmol), and the reaction mixture was stirred for 20 minutes. The reaction was then allowed to warm to room temperature, and iodomethane (0.06 mL, 0.89 mmol) was added via syringe. After starting material was consumed, the mixture was partitioned between aqueous NaHCO<sub>3</sub> and methylene chloride, then the organic layer was washed with brine (2x), dried (MgSO<sub>4</sub>) and concentrated. The residue was purified by silica gel flash chromatography (5% MeOH/CHCl<sub>3</sub>) to give 0.107 g (100%) of the title compound as a white powder. mp 73-74°C. MS (DCI/NH<sub>3</sub>) m/e: 207 (M + H)<sup>+</sup>, 224 (M + NH<sub>4</sub>)<sup>+</sup>. <sup>1</sup>H NMR (CDCl<sub>3</sub>, 300 MHz) δ 8.33-8.28 (m, 2H), 7.24-7.18 (m, 2H), 4.14 (dd, J=9.5, 4 Hz, 1H), 4.04 (dd, J=9.5, 4.4 Hz, 1H), 3.93 (m, 1H), 2.92 (s, 3H), 2.52 (m, 1H), 2.45-2.21 (m, 2H), 1.98 (m, 1H). Step 19c. 3-((*cis*-1,5-dimethyl-2-(S)-pyrrolidinyl)methoxy)pyridine

To a solution of the compound of step 19b above (0.400g, 1.94 mmol) in anhydrous THF at 0°C was added methylmagnesium chloride (Aldrich Chemical Co., 3M solution in THF, 1.94 mL, 5.80 mmol). The reaction mixture was stirred at this temperature for 2 hours, then brought to room temperature and sonicated for 30 minutes followed by stirring for 1 hour. After the starting material was consumed the reaction was quenched with MeOH. Bromocresol green indicator was added followed by enough 2N HCl/MeOH to turn give a yellow color (acidic pH). Sodium cyanoborohydride (.182g, 2.92 mmol) was added to the reaction and the mixture was stirred for an additional 3 hours (adding 2N HCl/MeOH to maintain the pH). Saturated K<sub>2</sub>CO<sub>3</sub> was added until the mixture was basic, then CH<sub>2</sub>Cl<sub>2</sub> was added to extract the desired material. The organic layer was then washed with a brine solution (2X) and dried over MgSO<sub>4</sub>. The resulting material was

3-((trans-4-cyanomethyl-1-methyl-2-(S)-pyrrolidinyl)methoxy)pyridine dihydrochloride

Step 21a. 3-(1-methyl-4-hydroxymethyl-5-oxo-2-(S)-pyrrolidinylmethoxy)pyridine

5 A 4.12 g (20 mmol) sample of 3-((1-methyl-5-oxo-2-(S)-pyrrolidinyl)methoxy)pyridine, from Example 19b above, was dissolved in 50 mL of dry THF and cooled to -78°C. To this solution was added 14.67 mL (22 mmol) of LDA, and the mixture was stirred for 1 hour. The temperature of the reaction mixture was allowed to warm to between -20°C and -10°C, and 4 g (200 mmol) of paraformaldehyde was added.

10 The mixture was stirred at this temperature for 3 hours, then quenched by addition of H<sub>2</sub>O, and taken to dryness. The residue was repeatedly triturated with ethyl acetate to dissolve the product. The solvent was removed, and the residue was purified on a silica gel column, eluting with 100:1 to 100:10 CHCl<sub>3</sub>:methanol, to afford 2.90 g of the title compound.

Step 21b. 3-((4-hydroxymethyl-1-methyl-2-(S)-pyrrolidinyl)methoxy)pyridine

15 A 401 mg (2 mmol) sample of 3-(1-methyl-4-hydroxymethyl-5-oxo-2-(S)-pyrrolidinylmethoxy)pyridine, from step 21a above, was dissolved in 6 mL of THF and 6 mL of 1M BH<sub>3</sub>•THF was added. The mixture was heated at reflux for 2 hours, then treated with methanol and stirred at room temperature for 15 minutes. The solvent was removed under pressure, and the residue was dissolved in 4 mL of ethanol. To this

20 solution was added 251 mg of CsF, and the reaction mixture was heated at reflux for 16 hours. The solvent was removed, and the residue was purified on a column of silica gel, eluting with 100:5 to 10:1 chloroform:methanol to give 78 mg of a mixture of *cis* and *trans* product.

3-((cis-3-propyl-2-pyrrolidinyl)methoxy)pyridine dihydrochlorideStep 23a. cis-1-BOC-3-propyl-2-pyrrolidinemethanol

10 A 400 mg (1.6 mmol) sample of 1-BOC-3-propyl-2-carboxylic acid methyl ester (prepared according to Chung *et al.*, *J. Org. Chem.*, **55**:270-275 (1990)) was dissolved in 12 mL of THF and cooled to 0°C. To this solution was added 3.0 mL of 1M LAH, and the mixture was stirred at 0°C for 30 minutes. The reaction was quenched by sequential addition of 0.11 mL of H<sub>2</sub>O, 0.11 mL of 40% NaOH and 3.00 mL of H<sub>2</sub>O, and the mixture was stirred for 30 minutes. The mixture was filtered, and the filtrate was concentrated. The residue was purified by chromatography on silica gel to give 240 mg of the title compound.

Step 27a. 3-((trans-1-methyl-4-hydroxy-5-oxo-2-(S)-pyrrolidinyl)methoxy)pyridine  
A sample of the compound from Example 19b (1.0 g, 5.6 mmol) was dissolved in 25 mL of THF and cooled to -78°C. LDA (1.5 M in hexane, 7.5 mL, 11.2 mmol) was added, and the solution was stirred at -78°C for 30 min. Next a solution of 1.17 g (5.12 mmol) of (+)-(camphorsulfonyl)oxaziridine in 24 mL of THF was added. After stirring at -78°C for 1 h, the reaction mixture was gradually allowed to warm to room temperature and stirred for an additional 2 hours. The reaction was then quenched by addition of methanol. The resultant mixture was stirred for 15 min, and the solvent was removed. The residue was subjected to flash chromatography on silica gel using chloroform:methanol (10:1) as eluant. The title compound was isolated as an oil (0.76 g, 69% yield). extracted with chloroform. The solvent was removed, and the residue was purified by chromatography on silica gel to give 780 mg of title compound.

Step 27c. 3-((trans-1-methyl-4-hydroxy-2-(S)-pyrrolidinyl)methoxy)pyridine dihydrochloride

5 A sample of the compound from step 27b was reacted under nitrogen with borane in THF (2.5 mL, 2.48 mmol, of a 1 M solution of borane in THF added dropwise over a period of 5 minutes). After stirring under reflux for 3 hours, methanol was added dropwise, and the mixture was stirred for an additional 15 minutes. The solvent was then removed *in vacuo*, affording a white solid. This solid was dissolved in anhydrous ethanol.

10 cesium fluoride (0.286 g, 2.48 mmol) was added, and the resultant solution was stirred at room temperature for 16 hr. 10 Step 33c. 1-BOC-2-(S)-2-(2-hydroxyethyl)pyrrolidine

To a solution of the product of Example 33b (6.80 g, 26.5 mmol) in anhydrous toluene (100 mL), cooled to -78°C was added a 1M solution of diisobutylaluminum hydride in toluene (132.5 mL, 132.5 mmol). The mixture was stirred at -78°C for 2 hours, then the reaction was quenched at -78°C with methanol (150 mL). The mixture was poured into 1M Rochelle salt (500 mL), and the emulsified solution was extracted with ethyl acetate (200 mL). The organic layer was washed with brine, dried over MgSO<sub>4</sub>, and concentrated. The residue was purified on silica gel, eluting with methanol/methylene chloride (5:95) to yield a colorless oil (3.82 g, 67%). <sup>1</sup>H NMR (CDCl<sub>3</sub>, 300 MHz) δ 1.47 (s, 9H), 1.58-1.76 (m, 2H), 1.82-2.05 (m, 3H), 3.31 (t, J=6.0 Hz, 2H), 3.50-3.69 (m, 2H), 4.10-4.21 (m, 1H), 4.43 (dd, J=4.0, 7.0 Hz, 1H). MS (DCI/NH<sub>3</sub>) m/e: 216 (M+H)<sup>+</sup>.

25 Step 33d. 3-(2-(1-BOC-2-(S)-pyrrolidinyl)ethoxy)pyridine

To a solution of triphenylphosphine (3.39 g, 12.9 mmol) in THF (10 mL) was added DEAD (2.03 mL, 15.5 mmol), and the mixture was stirred at room temperature for 20 minutes. Then 3-hydroxypyridine (1.23 g, 15.5 mmol) in 10 mL of THF was added, and the mixture was stirred at room temperature for 10 minutes. The alcohol from step 33c above (2.31 g, 10.80 mmol) in 10 mL of THF was then added, and the mixture was stirred for 16 hours and concentrated *in vacuo*. The residue was triturated with hexane, then the filtrate was concentrated and purified on silica gel, eluting with ethyl acetate/hexane (1:1) to afford an oil (2.58 g, 84%). Step 43b. 3-acetoxy-6-bromopyridine.

To 25.6 mL of boron trifluoride etherate (208 mmol, Aldrich) cooled to -15°C under 20 N<sub>2</sub> was added 18 g (104 mmol) of 3-amino-6-bromopyridine (from step 28a above) dissolved in 35mL of dimethoxyethane. Then *t*-Butyl nitrite (14.7 mL, 125 mmol, Aldrich) was added at a rate which kept the temperature below 0°C. Dimethoxyethane (65 mL) and 25 methylene chloride (60 mL) were then added to aid stirring. After 10 minutes at -10°C the mixture was allowed to warm to 5°C and stirred for 30 min. Pentane (400 mL) was then added to the reaction mixture, the solid was collected by suction filtration, washed with cold ether, air dried, and dissolved in 125 mL of acetic anhydride. The resulting solution was heated to 100°C ± 5°C for 1 hour. The solvent was removed *in vacuo*, and the residue was suspended in saturated aqueous Na<sub>2</sub>CO<sub>3</sub>, and extracted with ethyl ether. The ether solution was dried over MgSO<sub>4</sub>, the solvent was removed *in vacuo*, and the residue was 30 chromatographed on silica gel, eluting with 100:0 to 60:40 hexane:ethyl acetate to give 13.6 g of the title compound. <sup>1</sup>H NMR (CDCl<sub>3</sub> 300 MHz) δ 8.20 (m, 1H), 7.51 (d, J = 8.5 Hz 1H), 7.38 (dd, J = 2.9, 7.5 Hz, 1H), 2.35 (s, 3H). The compound of Example 52b (12.6 g, 67 mmol) was treated with t-butyl nitrite and  $\text{BF}_3\cdot\text{OEt}_2$  followed by acetic anhydride according to the procedure of Example 43b. The crude product was chromatographed (silica gel; hexanes/EtOAc, 4:1) to afford the title compound (12.0 g, 58%). TLC  $R_f$  0.5 (2:1 hexanes/EtOAc). MS (DCI/NH<sub>3</sub>) m/z 230 ( $\text{M}+\text{H}^+$ ), 188.

Step 52d. 3-bromo-5-hydroxy-2-methylpyridine

The product of Example 52c was stirred with 15% NaOH (75 mL) at 0 °C and then allowed to warm to ambient temperature. After 1 hour, the mixture was acidified with 6N HCl with cooling, and the resulting suspension was extracted with EtOAc. The EtOAc was washed with  $\text{H}_2\text{O}$ , dried ( $\text{MgSO}_4$ ) and concentrated to provide 7.0 g (95%) of the title

Step 52e. 5-bromo-6-methyl-3-(1-BOC-2-(S)-azetidinylmethoxy)pyridine

5 Triphenylphosphine (6.3 g, 24 mmol) was dissolved in THF (100 mL), cooled to 0°C and treated with DEAD (3.8 mL, 24 mmol) for 15 minutes. Then the compound of Example 52d (3g, 16 mmol) and 1-BOC-2-(S)-azetidinemethanol(3.4 g, 18 mmol) were added, and the mixture was allowed to warm slowly to ambient temperature. After 3 days, the solvent was evaporated and the residue was chromatographed (silica gel; hexanes/EtOAc, 4:1) to provide the title compound as an oil, contaminated with byproduct derived from DEAD reagent. For the title compound: TLC  $R_f$  0.6 (1:1 hexanes/EtOAc). MS (DCI/NH<sub>3</sub>) m/z 357 ( $M+H$ )<sup>+</sup>, 279.

Step 52f. 5-bromo-6-methyl-3-(2-(S)-azetidinylmethoxy)pyridine hydrochloride

15 The product of example 52e (0.4 g, 1.12 mmol) was dissolved in methylene chloride (4 mL) and treated with TFA (2 mL) at 0°C for 1 hour. The solution was concentrated, and the residue was mixed with saturated bicarbonate and extracted with methylene chloride. The combined organic layers were washed with  $H_2O$ , and dried ( $MgSO_4$ ). Evaporation of the solvent provided 0.25 g (76%) of neutral product, which was dissolved in ether and treated with 1N HCl in ether. **Example 54****5-nitro-3-(1-methyl-2-(S)-azetidinylmethoxy)pyridine hydrochloride**

The product of Example 53b (200 mg, 0.956 mmol) was treated according to the procedure of Example 14. The mixture was then acidified to pH=1 with HCl, and extracted with ether. The aqueous layer was made basic with 15% NaOH, and this solution was extracted with methylene chloride. The extract was dried (MgSO<sub>4</sub>), filtered, and concentrated in vacuo. The residue was purified (silica gel; CHCl<sub>3</sub>:MeOH, 98:2) to afford the pure free base (168 mg, 78%). The free base was converted to the salt by treatment with saturated HCl in ether to give the title compound.

Step 55c. 3-acetoxy-6-fluoro-5-methylpyridine

To boron trifluoride etherate (10 mL, 81 mmol) at -15°C under N<sub>2</sub> was added the product of step 55b (5.1g, 40 mmol) in DME (30 mL). *t*-Butyl nitrite (5.5 mL, 46 mmol, Aldrich) was added at a such a rate that the temperature remained below 0 °C. Additional 5 DME (25 mL) was then added. After 10 minutes at -10°C the reaction was allowed to warm to 5°C and stirred for 30 min. Pentane (400 mL) was then added to the reaction mixture, the solid was collected by suction filtration, washed with cold ether, air dried, and dissolved in 100 mL acetic anhydride. The resulting solution was heated to 77° C ± 5°C for 1 hour. The solvent was removed *in vacuo*, and the residue was suspended in saturated 10 aqueous Na<sub>2</sub>CO<sub>3</sub> (200 mL) and extracted with ethyl ether (2 x 150). The ether solution was dried (MgSO<sub>4</sub>) and concentrated. The crude product was chromatographed (silica gel; hexane/EtOAc 9:1 to 7:3) yield 3.62g (53% ) of the title compound. Step 56b. 6-Chloro-5-methyl-3-(2-(S)-azetidinylmethoxy)pyridine benzoate

Starting with the product of Example 56a in place of 3-amino-6-fluoro-5-methylpyridine, the procedures of Examples 55c-55f are followed to prepare the title 20 compound.

## Example 57

5-Bromo-6-fluoro-3-(2-(S)-azetidinylmethoxy)pyridine hydrochlorideStep 57a. 3-Bromo-2-(4-nitrophenylazo)-5-hydroxypyridine

5-Bromo-3-pyridinol from Example 44a (8.7 g, 0.05 mmol) and KOH (1.1 g, 19.6 25 mmol) were dissolved in water (200 mL). A suspension of p-nitrobenzenediazonium tetrafluoroborate (11.84 g, 0.5 mol, prepared as described in *J. Org. Chem.*, **44**: 1572-15783 (1979)) was added. The reaction was stirred for 1 hour, diluted with acetic acid (50 mL) and filtered. The crude product was allowed to air dry, then it was chromatographed (silica gel, eluting with chloroform/methanol 95:5-90:10) to provide the 30 title compound (5.45 g, 33.7 % yield). MS (DCI/NH<sub>3</sub>) m/z 323, 325 (M+H)<sup>+</sup>. NMR (DMSO-*d*<sub>6</sub>, 300 MHz) δ 8.48-8.43 (m, 2H), 8.21 (d, J=2.4 Hz, 1H), 8.09-8.06 (m, 2H), 7.72 (d, J=2.4 Hz, 1H).

Step 57b. 2-Amino-3-bromo-5-hydroxypyridine

The compound from step 57a above (5.0 g, 15.8 mmol) and tin chloride (25 g, 111 35 mmol) were suspended in conc. HCl and ethanol (150 mL), and the mixture was heated at reflux for 1 hour. The mixture was cooled to 0°C, then filtered. The filtrate was neutralized with sodium bicarbonate (180 g) and extracted with ethyl acetate (4 x 200 mL).

Step 57c. 3-Bromo-2-fluoro-5-hydroxypyridine

The compound from step 57b (3.0 g, 15.9 mmol) was dissolved in HF-pyridine (50 mL). The solution was cooled to 0°C and stirred under nitrogen, then sodium nitrite (1.09 g, 15.8 mmol) was added in portions over 20 minutes. The mixture was heated to 10 50°C for 1 hour, cooled to 0°C and basified with 20% NaOH. The aqueous phase was washed with methylene chloride (5 x 100 mL), neutralized with HCl, and extracted with ethyl acetate (5 x 100 mL). The extracts were dried ( $MgSO_4$ ), filtered and concentrated *in vacuo*, yielding the title compound as a tan solid. MS (DCI/ $NH_3$ ) m/z 192, 194 ( $M+H$ )<sup>+</sup>. NMR (DMSO-*d*<sub>6</sub>, 300 MHz)  $\delta$  9.38 (d, *J*=2.6 Hz, 1H), 9.20 (d, *J*=2.6 Hz, 1H).

15 15 Step 57d. 5-Bromo-6-fluoro-3-(2-(S)-azetidinylmethoxy)pyridine hydrochloride

Following the procedures of Example 2a-b, except substituting the product from step 57c for the 5-bromo-6-chloropyridinol-3-ol thereof, the title compound is prepared.

**Example 58**

## Examples 73-87

In the following Examples, the starting materials (from Examples 41, 53, 60, and 62-72, as appropriate) are stirred under an atmosphere of hydrogen in the presence of 10% palladium on carbon and the progress of the reaction is monitored by TLC. When consumption of starting material is complete, the mixture is filtered, and the filtrate is concentrated. The residue is subjected to BOC deprotection under acidic conditions and isolation and salt formation as in Example 2b. Products with R<sup>1</sup> = methyl are obtained by treating the starting material under the conditions of Example 2b and 3 prior to conducting the above-described hydrogenation step.

## Examples 88-94

Following the procedures of Example 52b-f, except substituting the starting material indicated below for the 1-BOC-2-(S)-azetidinemethanol in step 52b, and omitting the methylation step, the compounds of examples 88-91 are prepared. Following the procedures of Example 52b-f, except substituting the starting material indicated in the below for the 1-BOC-2-(S)-azetidinemethanol in step 52b the compounds of examples 92-94 are prepared.

## Examples 184-215

The starting material compounds shown in the table below (some of which are BOC intermediates of Examples 168-183) are treated with 2,4-dinitrophenyl formate (for Examples 184-199) or acetic anhydride (for Examples 200-215). The product is subjected to BOC deprotection, isolation and salt formation as in Example 2 and 3.

## Examples 216-247

The starting material compounds shown in the table below (some of which are BOC-intermediates from Examples 184-215 above) are treated with borane as in Ex 1d followed by deprotection and salt formation as in Example 2b to give the product 5 compounds shown. For products with  $R^1 =$  methyl, BOC-deprotection as in Example 2b and N-methylation precede the treatment with borane.

## Examples 248-271

The starting material compounds shown in the table below (some of which are BOC-protected intermediates of Examples 88-94 above) are treated as in Example 45 (for examples 248-263 wherein  $R^4$  = ethyl). In Examples 264-271, wherein  $R^4$  = propyl, the intermediates are treated as in Example 45 except substituting allyl tri-n-propyltin for the vinyl tri-n-butylin therein.

We Claim:

1. A compound or pharmaceutically acceptable salt or pro-drug thereof wherein said compound has the structure:

5

I

wherein the asterisk denotes a chiral center;

n is an integer selected from 1, 2, or 3;

10 X is oxygen or sulfur;

R<sup>1</sup> is selected from the group consisting of hydrogen, allyl, and C<sub>1</sub>-C<sub>6</sub>-alkyl;

15 R<sup>2</sup> is hydrogen or, when n=2, is a single substituent selected from the group consisting of

CH<sub>2</sub>OH,

CH<sub>2</sub>F,

CH<sub>2</sub>CN,

CH<sub>2</sub>OCH<sub>3</sub>,

Br,

Cl,

F,

OH,

CN,

20 C<sub>1</sub>-C<sub>3</sub> alkoxy,

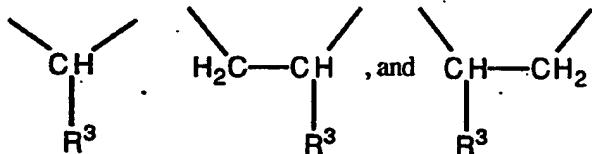

OCOCH<sub>3</sub>, and

O-methanesulfonyl,

25 with the proviso that when R<sup>2</sup> is substituted at the 3-position or the 5-position of the pyrrolidinyl ring, it is a C<sub>1</sub>-C<sub>3</sub>-alkyl group;

30

A is selected from the group consisting of

where R<sup>3</sup> is H or C<sub>1</sub>-C<sub>6</sub>-alkyl;

5

y is an integer selected from 1, 2 or 3, with the provisos that:

- a) when y = 1, R<sup>4</sup> is selected from the group consisting of
  - (i) a single substituent at the 2-position of the pyridine ring selected from the group consisting of chlorine and fluorine, and
  - (ii) a single substituent substituted at the 5- or 6-position of the pyridine ring selected from the group consisting of
    - CN,
    - CF<sub>3</sub>,
    - NO<sub>2</sub>,
    - CH<sub>2</sub>OH,
    - CH<sub>2</sub>CN,

160 9. A pharmaceutical composition comprising an amount of a compound as  
defined by Claim 1 effective to control chemical synaptic transmission in a mammal  
in combination with a pharmaceutically acceptable carrier.

10. A method of controlling chemical synaptic transmission in a mammal comprising  
administering to a mammal in need of such treatment an effective amount of a  
compound as defined by Claim 1.

## INTERNATIONAL SEARCH REPORT

Internal Application No  
PCT/US 96/07804A. CLASSIFICATION OF SUBJECT MATTER  
IPC 6 C07D401/12 A61K31/44

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 6 C07D A61K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	WO,A,94 08992 (ABBOTT LAB) 28 April 1994 cited in the application see the whole document -----	1-10

 Further documents are listed in the continuation of box C. Patent family members are listed in annex.

## \* Special categories of cited documents :

- \*A\* document defining the general state of the art which is not considered to be of particular relevance
- \*E\* earlier document but published on or after the international filing date
- \*L\* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- \*O\* document referring to an oral disclosure, use, exhibition or other means
- \*P\* document published prior to the international filing date but later than the priority date claimed

\*T\* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

\*X\* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

\*Y\* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

\*Z\* document member of the same patent family

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US 96/07804

### Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:  
**Remark: Although claim 10 is directed to a method of treatment of the human/animal body the search has been carried out and based on the alleged effects of the compounds/compositions.**
2.  Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3.  Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

#### Remark on Protest

The additional search fees were accompanied by the applicant's protest.  
 No protest accompanied the payment of additional search fees.
